Introduction

- ❑ Isn't it time consuming while standing for hours in vaccination queue??
- ❑ Even after standing for hours we are not sure if vaccine will be available.
- ❑ To solve this problem we need to do something.
- ❑ Is there any solution?????????

Proposed solution

- ❑ Web-based Vaccinator is the way to manage the citizens traffic via digital sign-in and online databases.
- ❑ Vaccinator : A web app tha that will be scheduling citizens vaccination appointment with a generated token.
- ❑ A login logout account for regional vaccination centers which will update citizens about vaccine availability.

What citizens need to do?

- ❑ Register on site with information.
- ❑ Select nearest vaccination centers.
- ❑ Check update from vaccination center about availability of vaccines.
- ❑ Visit center with generated token at time of vaccination.

What Centers need to do?

- ❑ Register on site with information as vaccination center.
- ❑ Update status about no of vaccines available, open/closed update of vaccination center.
- ❑ Manage vaccines according to no of citizens taking appointments on day of vaccination.

Merits/Demerits

Merits hi merits hai

Saves time of citizens

No need to stand in long ques

On web notifications about
availability of vaccines

Schedule your vaccination
date

Ajun ky pahije

Needs to check schedules

Need to check availability of center
and vaccine

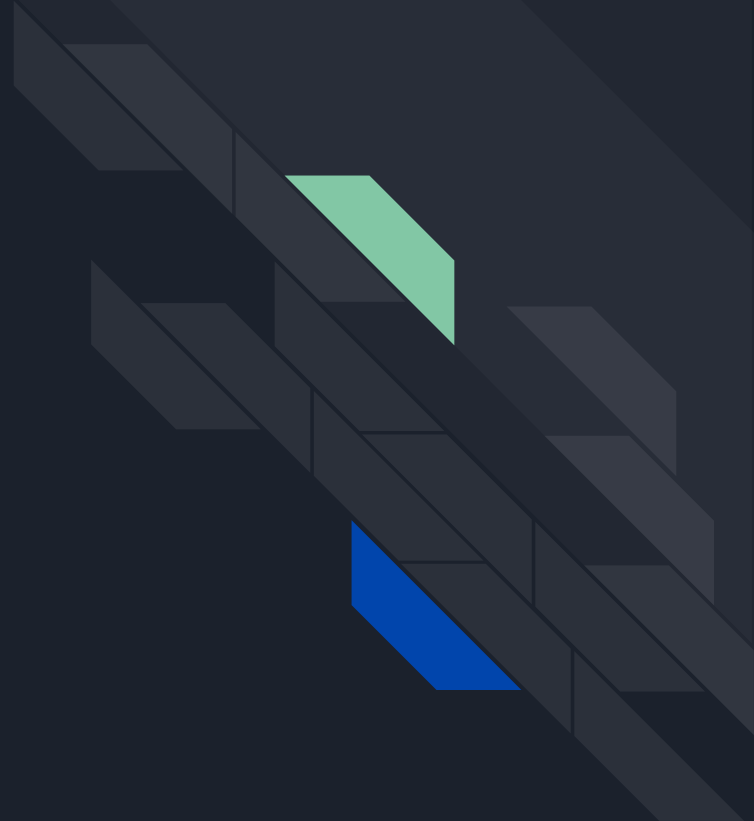

Uses

- ❑ Can be used by citizens as well as vaccination centers.
- ❑ Monitor and analyze region wise vaccination data
- ❑ Based on token generation.

Conclusion

This project idea can be implemented in a realtime if supported with proper resources and can make a huge difference in vaccination monitoring. In this hackathon we will be trying to make a working prototype of idea.

THANK YOU!!
